## Jeeves Sales Configurator, powered by Tacton, helps companies within the manufacturing and telecom industries to efficiently sell customized products.

The Sales Configurator makes possible automated configuration within the framework of the Jeeves business system. In contrast to many other solutions on the market, it's easy to create and maintain your own configuration solutions even for the most complex products. Jeeves Sales Configurator is fully integrated with the business system and can also be easily connected to other central applications such as CAD and PLM.

### Needs-based configuration:

No need to answer detailed technical questions in order to configure a product. All that's needed is to state your needs, then the configurator can create the technical solution to match your requirements.

### Non-linear configuration:

No need to answer questions in a specified order. Instead answer those questions which are most important to you and the configurator takes care of the rest.

### Guaranteed correct products with powerful conflict resolution:

With each choice the configurator ensures that it is compatible with previous choices.

### Optimization:

The configurator can optimize the product based on specified criteria. This means that the product is always put together in the best way according to the specified optimization. It could be the cheapest solution, the solution with the highest performance, the smallest solution or based on any other quantifiable property. After each user choice, the configurator finds the combination of product components which gives the best solution.

### Easy to create configuration models:

A big advantage is that the people with expert knowledge of the products can also use the configuration design tools. With most other configuration solutions this is impossible since they require programming expertise. With Jeeves Configurator, configuration models are created using a graphical modelling tool which uses drag-and-drop.

### Easy to integrate with surrounding systems:

Perhaps all the information required by the configurator resides in Jeeves. Perhaps there are for example, drawings within a CAD system, and the result of the configuration is a modified CAD-drawing. With Jeeves sales configurator it's fully possible to create a connection to this or any other system.
